

MODULAR FURNITURE SYSTEM

ABSTRACT OF THE DISCLOSURE

A modular furniture system has a number of variously configured work surfaces, a number of variously configured support members, variously configured hutch units, and a number of couplers. At least two support members and a work surface are arranged and coupled together to construct a work station. The work surfaces have at least three sides with at least two of the sides being adapted to releasably couple with one of the support members. The support members may include leg supports and storage cabinet supports, each of which are adapted to couple with and support a work surface above a floor. The hutches are adapted to removably rest upon a work surface or a storage cabinet support member. Further, the hutches, the work surfaces, and the support members may be provided with cable passages to facilitate use of electronic equipment at a work station.
